A
FREQUENCY DICTIONARY
OF
CONTEMPORARY WRITTEN SCOTS

For Educationists, Editors and Writers
whom require reassurance in their spelling choices,
and Corpus Planners who may be engaged
in increasing consistency within the written form

By CHRISTOPHER D. GILMOUR

Based on a three million word
Corpus of 21st Century Scots Texts
Comprised of writing from
over 600 Moderns Scots writers

First Edition
Hertfordshire
2024

First published in Great Britain by ILL AND ANCIENT in May 2024

Typeset in L^AT_EX by Christopher D. Gilmour

Introduction

This frequency dictionary has two major differences from other frequency dictionaries of the type published by notable houses, such as Routledge.

Firstly, it has been compiled by an layman with no formal linguistic training except in high school from thirty years ago.

Secondly, the degree to which the written Scots language is standardised has become somewhat opaque over the past hundred years, developing various regional dialects with prominent idiosyncracies, in a way that varieties of English barely suffer from.

Since the first Scots language dictionaries of 1808, competing spellings variants have been recorded, and embraced, with little judgement as to which is the "right" form and which is "wrong". This frequency dictionary is not intended to be prescriptive, and arbitrarily decide what spellings are best, I am an Englishman and it just wouldn't do.

But by illuminating which spellings are more popular among Scots writers, perhaps new writers and readers can better gauge stylistic choices - is a chosen spelling to be a popular form, a regional form or some idiosyncratic form.

An earlier literary venture for me was the compiling and publishing of a Scots rhyming dictionary. The very first review of which was quite scathing and suggested that it was "positively harmful" to the "language as a whole". Naturally I disagree. The rhyming dictionary sold relatively few copies. Whatever effect it had on the language, whether positive or harmful, is several orders of magnitude less than the effect on a language by writers who sell thousands of copies of dozens of titles.

If we were to draw up a list of the people who have done the most damage to the Scots language, we might consider the Scottish Education Department committee who decided in 1947 that "...schools should wage a planned and unrelenting campaign..." against the language as it was used, and "...the first duty of the infant teachers, and the continuing duty of all primary teachers, is to implant and cultivate fluent speech in standard English".

It should be noted that this frequency dictionary does address the "language as a whole" to a greater degree than a rhyming dictionary does. But, like the Scots rhyming dictionary, it is the first of its kind, there are currently no other Scots frequency dictionaries that may be compared against each other.

I doubt many copies of this book will be sold or read, so its unlikely it will have much effect on a language used by more than two million people. It merely tries to quantify that usage, rather than prescribe it.

It is with regret that I note that my words don't have some kind of inexplicable ability to influence nations!

Christopher D. Gilmour

May 2024

Hertfordshire, UK

0.1 How to use this dictionary

This dictionary is aimed at people who might not be as familiar with written Scots language as they may wish to be, editors, educators, fluent speakers who have never had the need to write it, interested linguists, politicians, dialecticians who are aching for a fight on social media.

There are three main sections:

First - a ranked dictionary of all the word forms from most frequently used - to roughly the 2,500th least frequently used. You may wish to idly browse this section.

Second - a few lists of words with statistics that might be of interest, perhaps to scrabble players or people who like numbers and lists.

Last - all the words and spelling variants in alphabetical order with references to the most common variant. The lazy subeditor might just use this section to nudge and correct spellings. I wouldn't recommend this behaviour, but realistically it is quicker than actually looking up each word, and making a quantitative judgement; this strategy will see you right nine times out of ten.

In contrast to other frequency dictionaries and word lists, each entry is designed to stand alone to some extent, without very much explanation of what the numbers mean or abbreviations.

0.2 The Square-Mile Dialectician

I note again, that among our new dialecticians, the local habitat of every dialect is given to the square mile.

- Robert Louis Stevenson (1898) (Underwoods)

For the purposes of this frequency dictionary, I wish to reject the entire notion of the square-mile dialectician.

There was a chap on the social media website Twitter (now X), at the time of writing, arguing that the Scots word for HEAD might be HEID or HEDE or HEED and it depends on where you live and the local dialect ... If Scots were a language there'd be one uniform spelling across the country.

If you are unfamiliar with written Scots this sounds reasonable. You might think I spell it one way, other people spell it another way, but I haven't read enough of their writing to be sure.

With this frequency dictionary we can look up the entry for HEID, and see that it is correct that there are four different spellings of the word.

heid	3,359	291 writers
head	247	62 writers
heed	57	15 writers
hede	4	1 writer

We note that one of the spellings is about twelve times more common than the other spellings, and also that this most common spelling is used by five times more writers than the next most popular spelling. This most common spelling is therefore, literally, the uniform spelling used across the country.

Here we might note that HEAD, HEED and HEDE are perfectly fine spelling variants, but they are not the widely-used supra-regional standard form.

Whilst it may be accurate that in one single locale there is a distinct spelling of a word or an entirely different synonym, it does not follow that every different locale or square-mile has its own distinct spelling.

We can respect that one locale for having a non-standard form without expecting an infinite number of other non-standard spellings. As in the case of HEID, most words have one single supra-regional form.

0.3 The Corpus of 21st Century Scots Texts

The word frequencies are taken from the Corpus of 21st Century Scots Texts which the author compiled during the Covid lockdowns of 2020 and 2021. This corpus contains more than three million words, from more than 600 writers. The harvesting of texts took a quite broad and greedy definition of Scots writing, anything that wasn't standard English and looks like its Scots.

The search for Scots texts was far and wide and exhaustive. This covered both books that had won "Book of the Year" in the "Scots Language Awards", poems from Lallans Magazine, blogs and tweets.

All regional dialects of Scots are represented to some extent.

Dialect	Corpus tokens	Writers
Central	1,896,722	304
Doric	649,219	137
Ulster-Scots	219,103	47
Orkney	99,255	44
Shetland	168,284	57
Southern	90,827	17

One of the guiding principles when compiling the corpus of 21st century Scots texts was to capture how people currently write Scots - if someone is writing Scots today, what spellings will they use.

And so if a choice was presented between including 10,000 words written in 2022 by a little-known contemporary writer, or 50,000 words of Robert Burns written in 1787, the first option would be chosen.

Every older text is further away from how Scots is written today.

The 2011 censuses of Scotland and Northern Ireland reported that there are more than two million people who understand Scots, arguably more people than any other point in the history of Scotland. Within this population there were at least 1.26 million people would reported they could write Scots. This isn't a language where we might struggle to find writers and have to resort to scouring the history books.

With this huge number of people reporting the ability to write Scots, we might ask, who are they and where do they do their Scots writing?

The census provides indicative data about how they are dispersed around the country: about one in five people in Glasgow reported they could write Scots about two in five people in Aberdeenshire in traditionally Gaelic speaking areas, like the Isle of Lewis, it was barely one in a hundred who could write Scots, but in Orkney and Shetland it was close to half the population.

As to where they do their writing, no answer could be found. There are around four hundred published writers of Scots, in both poetry and prose. On social media there were around 100 people on Twitter who regularly tweeted in Scots, a dozen or so on other networks, perhaps two hundred on Facebook.

In total I could find about 600 people to represent the writing of 1.26 million, or an average of 2,150 census respondent represented by each corpus writer.

When in the frequency dictionary we see that 291 writers are recorded as using the spelling HEID, we might mentally extrapolate that about 650,000 people use this spelling and 32,000 use the HEED spelling.

heid	3,359	291 writers
head	247	62 writers
heed	57	15 writers
hede	4	1 writer

For the HEDE spelling, we don't really have enough information to gauge whether it's just an idiolect spelling used by a single writer, perhaps a single unintentional mis-spelling, or if it is representative of the orthography of a community of more than 2,000 Scots writers.

It could be argued that these single idiolect spellings shouldn't be included in the frequency dictionary, but that might be a case of oppression by omission. If they weren't included, we wouldn't have any estimate at all of how many people use them in relation to the other spellings.

On average each corpus writer represents 2,150 census people, though some areas are over-represented. Shetland has 57 writers in the corpus, and according to the census around 10,000 people with Scots writing ability, each corpus writer represents about 180 writers in the census.

With this in mind, the Central region dialect is under-represented in the corpus. It appears that it is easier for Insular Scots writers to be published than Central region Scots writers!

0.4 Registers

In composing frequency dictionary, it became evident that some realities of the shortcoming of the corpus have to be faced. There are several missing registers of Modern Scots writing.

Despite the existence of Scots Law, there is no legal register in the modern Scots language, lawyers use English prose, with some distinctly Scottish terms. Similarly whilst there are few academic papers written in modern Scots, perhaps between twelve and twenty - an academic register of modern Scots writing has not yet been firmly established.

The use of the language in mainstream advertising is limited, the register doesn't exist that is used to describe new consumer products in an attractive manner. Technical equipment instruction manuals do not exist in Scots, no matter how much you search among the translations of other languages, you won't find Scots in the manual for your new mobile phone.

Scots is not used in newspaper or media reporting, despite occasionally being seen in headlines. There is no news reportage register of modern Scots, although there are many opinion, colour and satirical columns written in neutral and regional dialect forms.

The missing registers will no doubt emerge and evolve over time if Scots is recognised and used more ubiquitously.

It would be incorrect to say that Scots is not spoken in the Scottish Parliament, a few times each year MSPs or invited guests take the opportunity to make speeches in Scots. However the origin of the transcriptions of these speeches is opaque, we do not know whether the individual making the speech has provided the spellings, or some constituency office intern, or the venerable transcribers of the Official Report office.

In light of this about 15% of the corpus is made up of poetry, 11% is from social media such as Facebook and Twitter, 7% is children's literature, 4% is from newspaper columns, 3% is from government reports and the remaining 59% is common prose from novels, blogs and other sources.

0.5 Oor-Wullification

There is a concept that has been called the Oor-Wullification of Scots spelling, whereby two hundred years ago spoken Scots sounded much the same as it does today, but written Scots used spellings that more distinctly English.

For example the word PARLIAMENT, any true Scots-speaker would instinctly know to pronounce it PAIRLAMENT, and it didnt require a distinctly Scots spelling. Likewise WULLIE as in Oor Wullie, a hundred years ago it was always written as WILLIE.

There is also a regionality aspect whereby a speaker in Aberdeenshire would see the word WHAT and know it was pronounced FIT, or someone from the Central region would know it was pronounced WHIT, without it having explicit spellings.

Conversely words like ONY or MAIR have had spellings distinct from English for at least six hundred years, and can be seen in works such as The Brus from the 14th century.

The contemporary Scots lexis could be divided into groups, words that have always been spelled in a distinctly Scots manner, and words where the popular spellings are changing to be more distinctly Scots.

Decisions about whether such things are to be encouraged or discouraged are for language planners who have the authority that comes with stewardship of the language.

This frequency dictionary provides a snapshot to how each spelling variant is currently used. It will take a more retrospective frequency dictionary to judge how usage is changing and to measure the extent of Oor-Wullification.

With the example of PARLIAMENT / PAIRLAMENT

parliament	85	36 writers
pairlament	186	22 writers
pairliament	69	20 writers

More unique writers use the PARLIAMENT spelling, but the PAIRLAMENT spelling is used more frequently, by the fewer writers who select it.

0.6 On Standardisation

I'm not equipped to define what standardisation means, but in the manner of "if it walks like a duck, quacks like a duck..." we can consider what the standardisation process of a language may look like.

Firstly, imagine a publisher with a small finite number of writers, who may work closely together. The publisher uses the same sub-editing process for similar writers, any spelling variances that may crop up are resolved and a uniform standard orthography is printed. The spelling choices may be carefully considered to appeal to the widest range of Scots readers possible, and correspond very closely with the supra-regional form discussed below.

Secondly, we might imagine a regional writers group, like the Orkney Voices or West Lothians Quill poetry and writing group. Any writing will be shared among the group, and spelling conventions become established as each writer reads the work of other similar writers within the same regional dialect. There might even be explicit discussions about spelling decisions.

So whereas multi-author anthologies and collections might be published undergoing a consistent sub-editing process, even without this writers within each group might implicitly derive an emergent standard.

Thirdly, we might imagine a standard created by scholars of Scots writing, academics who have spent years reading Scots writing from the past 800 years, valuing the ways that the

language has developed. Spelling orthographies that were popular in some centuries and fallen out of use or suppressed by other linguistic regimes, though free from the currency of modern times, paying respect to established writers of the past.

Fourthly, can we imagine a standard created from an actual convention of linguists from all over Scotland and beyond, carefully discussing each word, communally understanding what "a phonemic orthography" and "graphemes" are. And through discussion, negotiation, persuasion and horse-trading, establishing an "agreed orthography", among those stakeholders who were able to turn up.

Fifthly, let us imagine con-lang enthusiasts, people who understand languages and enjoy unilaterally constructing them, following whatever rules and consistency preferences they prioritise over others. To some extent, each individual writer falls into this category, writing based on their own best judgement to produce something that is internally consistent.

A summary of these five standard types:

- Commercial - used by a commercial publisher in order to sell books
- Regional - determined by a small regional group of stakeholders
- Traditional - determined by academic study over a long time frame
- Convention - agreed by a large group of established stakeholders
- Con-Lang - unilaterally determined based on stated or implied rules

There is some degree of overlap between these groups.

All of these types of standardisation would be describing the same language, and the distinct standards produced inherently overlap to a great extent. The handful of exceptions and differences between each would be understandable, and not very significant.

No distinct standard would be incomprehensible to an adherent of another standard.

0.7 The supra-regional variety

In his 2017 book on English grammar, *Making Sense: The Glamorous Story of English Grammar* eminent English linguist Professor David Crystal suggests the idea of a super-regional standard variety of a language that is held in equal respect to the regional non-standard varieties. Whilst he is talking about English, I'm not a linguist myself and I'm just clinging to whatever I saw in the last book I read, and this seems a useful paradigm to consider with Scots.

I don't know whether the supra-regional variety is emergent or enforced, but when considering regional differences in spellings this paradigm seems to fit.

If we looked at maps showing where writers have used the spellings SCHOOL, SCHUIL, SCHULE and SKWEEL, and COULD, CUD, CUID, COUD and CWID, we would see that one spelling is supraregional, used by writers in all regions and other spellings have either positive regional preferences or an aversion.

In the example of CUD and CUID, it is not straightforward to say that one spelling has a specific regionality and other other has a different regionality. CUID is not seen in Ulster-Scots but is seen in several of the mainland regions. CWID is only seen in Doric writing, so we can easily record its regionality.

For these sorts of reasons the regionality of every spelling variant is not recorded in the frequency dictionary for every word. There is usually one very popular spelling and then other less popular spellings that are used in two or more regions.

This paradigm doesn't fit all words, there are many exceptions where there is no agreed supraregional form, but two or more competing regional spellings. DINNA and DINNAE for example, the former having more of a preference in the North East, and the latter having more of a preference in the central belt.

The supra-regional variety, represents a demotic and emergent sixth type of standardisation, describing the same language as the other five types, and hugely overlapping with them.

Which variety of standardisation is best is an entirely subjective preference. I offer this as it makes sense to me.

Proponents of each variety might produce very reasonable arguments about why their method of standardisation is best or the optimum, but it does come down to how much value the individual places on each argument. And this will be different for a person creating a Scots language textbook for schools and people writing a local government policy document in Shetland, or someone writing personal poetry on the school bus.

There's no right answer, merely the satisfaction of different groups of stakeholders.

0.8 Order of spellings

An idiosyncratic method has been chosen for the ordering of different spellings listed for each entry in the dictionary.

If we didn't know the frequency of usage, we might consider alphabetical order would be satisfactory, it is the default position for most dictionaries. However this is a frequency dictionary. If we were native speakers with Scots as a first language, we might have an innate notion of which spellings were more common than others, but perhaps we might be biased by personal experience or knowledge of specific regional varieties.

However, we have quantitative data of usage frequencies to enable us to be more objective and overcome personal experience or lack thereof.

We might think that merely ordering by the frequency of occurrences is sufficient, the most frequently used spelling comes first, the least frequently used comes last and the spellings in between in a predictable manner.

But if we look at the number of writers who use each spelling, this sometimes produces a different sequence of spellings. A few expert writers of a specialist topic might use one spelling frequently, but many more lay-writers might use a different spelling less frequently; as there are more laypeople there it would seem that the second spelling is more widely used.

The general rule applied is to select the spelling with the most occurrences to come first and use as the headword, the spelling with the most distinct writers comes second, and subsequently spellings are ranked by the number of writers.

Where the number of writers for a spelling is the same as the number of writers for another spelling, then the number of occurrences takes priority.

Where there are a substantial number of hapax legomena, words with only one spelling in the corpus, thus implicitly only one writer, the words are ordered by the whims of the compiler.

Regarding hapax legomena - care has been taken to verify if these are just unique typing mistakes by the writer or optical character recognition errors. It is impossible to tell whether they represent a single writer's idiosyncratic spelling, or whether it is a common spelling used by a few hundred people who the writer represents.

We don't have enough information to rule out and disregard individual spellings, but we can compare their frequency to other more frequently observed spellings of the same word.

In English WHILE and WHILST have similar but different meanings, in Scots this is further complicated by the existence of WHILES, which means something different again. It's tempting to roll them all together into a single entry and let the writer choose which is most appropriate, but discretion is the better part of valour, and three entries are used here.

0.9 Contractions

Not sure whether to include words with apostrophes or contractions within the main frequency dictionary. I have included contractions in negation, like CAN'T and DIDN'T, but haven't included THEY'RE or I'M. Although this strategy feels a little problematic. Contractions are listed here outwith the main list.

THEY'RE

they're	739	121 writers
dir	56	3 writers (Shetland)
thur	68	6 writers
der	105	12 writers

ootta	2	2 writers
out ae	2	2 writers

0.10 Parts of Speech

One aspect of this dictionary that ought to be discussed further is parts of speech that are recorded for each entry. There has been far more resources and expertise deployed in corpus linguistics and natural language processing of the English language than of Scots, and whilst the differences in grammar and orthography between the two tongues have been documented at length by many writers over many centuries, there are no Scots-specific part-of-speech tagging software.

I have used the CLAWS7 tagset developed by Lancaster University and their English part-of-speech tagging software to suggest the most appropriate part of speech for each wordform listed in this dictionary.

This has presented a number of problems. The verbs of CLAWS7 are generally listed as follows:-

- VV0 - base form of lexical verb
- VVD - past tense of lexical verb (e.g. gave, worked)
- VVG - -ing participle of lexical verb (e.g. giving, working)
- VVI - infinitive (e.g. to give... It will work...)
- VVN - past participle of lexical verb (e.g. given, worked)
- VVZ - -s form of lexical verb (e.g. gives, works)

In Scots the -ing participle usually doesn't have the -g on the end (walkin, daen, eatin, etc) which means the abbreviation VVG doesn't sit right, VVN is already taken.

The -ed past tense in Scots often takes the form of -it, so VVD is less meaningful as an abbreviation. In fact the VVD and the VVN form of verbs are often identical.

I'm not here to create a new tagset specifically for the Scots language, a tagset that no one else will probably ever use, so I have just used the CLAWS7 tagset and added a few additional tags as deemed necessary.

The VV0 base form is almost always identical to the VVI infinitive form, and so I have taken the liberty of not explicitly noting the infinitive.

However, we must note that for one verb and one verb only, there is a distinct VVI infinitive form of the verb - ADAE is used by a significant number of writers as the infinitive form of DAE (to do), for example in the sentence *Thaive nuthin adae wi us* (They have nothing to do with us).

This spelling is also the Scots equivalent of ADO, as in the Shakespeare play *Much Ado About Nothing*. Whilst ADAE is often used in the same sense as ADO (a lot of activity, worry, or excitement that is unnecessary or greater than the situation deserves), it is also used in the infinitive sense of TO DO.

The pluralisation of nouns in Scots is a little different to English, where what would to English ears be the singular form is used as a plural, for example *five year frae noo*. Should the singular form be marked as also being the plural or is it some neutral for number arrangement? The English plural form is also found quite often.

Negation is another difference between Scots and English, the former using CANNAE or CANNA where English would use CAN'T or CANNOT, in order to stress this point a combined Part of Speech tag has been used - negated modal auxiliary (VMXX). This might make it easier for any future Scots Part of Speech Tagger to process the words instead of awkwardly trying to split a single wordform into two parts.

A category of wordform that has presented some difficulty is where there are very different meanings for the same spelling. An example of this is FELL, being both the past tense of the verb TO FALL and also an adjective meaning something of cruelty, Shakespeare used *One fell swoop*. Occurrences for both meanings have been swept into the same entry, leaving it to the reader to decide the relative frequencies.

The parts of speech recorded for each entry are for guidance, there are undoubtedly many

errors, real or perceived, in the parts of speech listed - it is hoped that others can do a better job of this in the future.

Parts of speech used are listed in an appendix.

Acknowledgments

I would like to thank Dr Paul Rayson, Professor Vaclav Brezina, Dr Dana Gablasova for inspiring me to attempt a Frequency Dictionary.

Dr Rhona Alcorn and all at the Dictionaries of the Scots Language for supporting the Corpus of 21st Century Scots Texts project.

I must thank my wife and children for leaving me alone to get on with this for a few minutes at the end of each day.

None of this would be possible without the work of six hundred or so Scots writers, most of whom will never know that I have read their writings and used their words here.

2 Word Lists and statistics

LENGTHS OF WORDS

Number of letters	Number of words	Text coverage
1	3	6.28%
2	39	16.50%
3	205	23.13%
4	593	17.18%
5	571	9.22%
6	510	5.57%
7	298	2.42%
8	153	1.07%
9	67	0.44%
10	35	0.18%
11	11	0.05%
12	8	0.07%
13	2	0.01%
14	1	0.003%

THE FIRST LETTER OF WORDS

Here we consider the first letter of the Entry word, and not necessarily the first letters of each individual variant. For example the Entry word CHRISTMAS has a spelling variant of XMAS, but only the C is counted, not the X.

Letter	Count (%)	Letter	Count (%)
s	331 (13.34%)	r	86 (3.44%)
b	190 (7.60%)	e	77 (3.08%)
c	173 (6.92%)	n	63 (2.52%)
t	169 (6.76%)	o	55 (2.20%)
p	162 (6.48%)	i	47 (1.88%)
f	151 (6.04%)	k	42 (1.68%)
w	146 (5.84%)	j	25 (1.00%)
a	129 (5.16%)	u	25 (1.00%)
l	129 (5.16%)	y	20 (0.80%)
h	124 (4.96%)	v	15 (0.60%)
m	119 (4.76%)	q	13 (0.52%)
d	110 (4.40%)	z	3 (0.12%)
g	96 (3.84%)		

DAYS OF THE WEEK**MONDAY**

TEMPORAL WORDS

At this point I must confess that the phrase THE MORRA (for TOMORROW) has somehow been

Item	Frequency per 100,000	Rank
day	199.36	69
time	197.09	70
year	74.50	152
mornin	55.77	198
days	50.24	217
the day	41.47	256
years	36.43	292
week	25.07	385
month	11.33	801
weeks	9.11	966
moment	7.97	1065
months	7.44	1124
yesterday	6.15	1301
date	5.38	1458
period	3.79	1871

missed in the frequency dictionary, and it would be an inordinate amount of effort to slot it in - this would disrupt the order of the entries, and in the indexing.

The entry including this term should be as follows

1503. TOMORROW

quasi-nominal adverb of time (RT)

Frequency

5.14 per 100,000 - 162 tokens

Variants

the morra	75	29 writers
tomorrow	44	18 writers
themorra	28	7 writers
tha morrow	3	3 writers (Ulster)
the morrow	6	1 writer
amorra	2	1 writer
tommorrow	1

TOP 50 VERB CONJUGATIONS

Except in the case of a few irregular verbs there are generally five forms of verbs used in Scots, namely the base form, the -s form, the -ing participle, the past tense, and the past participle. The last two forms are often identical.

The verb form in block capitals is the most frequently used spelling, other spellings are listed in order of popularity.

- | | |
|----------------------------------|-------------------------|

 VVD - BADE, bidit
 VVN - BIDDEN

50.

VVO - TRY
 VVZ - TRIES
 VVG - TRYIN
 VVD - TRIED
 VVN - TRIED

Proportions of Parts of Speech

This long list of word classes or parts of speech can be condensed into a smaller number of larger classes, with less nuance. The approximate proportions of each of these classes within the frequency dictionary is as follows. The sum of the percentages is greater than 100% because many words can belong to more than one class depending on how they are used, for example LICHT is a noun, an adjective and a verb.

noun	1,470 (58.8%)
verbs	1,082 (43.3%)
adjectives	426 (17.0%)
adverbs	183 (7.3%)
prepositions	63 (2.5%)
pronouns	55 (2.2%)
conjunctions	28 (1.1%)

Parts of Speech

The following parts of speech tags are used in the frequency dictionary:-

Articles

- article (AT)
- singular article (AT1)

Conjunctions

- coordinating conjunction (CC)
- adversative coordinating conjunction (CCB)
- subordinating conjunction (CS)
- as (as conjunction) (CSA)
- than as conjunction (CSN)
- the conjunction that (CST)
